

left ~~right~~ $j=0$

2	6	12	13	21
0	1	2	3	4
x	x	x	x	j

count=0

$j=0$

right

4	5	7	9	10	11
0	1	2	3	4	5
x	x	x	x	x	j

2 > 2x4 (X) ⁽²⁾ (i++)

① count = count + j = 0 + 0 = 0

6 > 2x4 (X) (i++)

count = count + j = 0 + 0 = 0

12 > 2x4 (✓) (j++)

12 > 2x5 (✓) (j++)

12 > 2x7 (X) ⁽³⁾ (i++)

① count = count + j = 0 + 2 = 2

13 > 2x7 (X) ⁽²⁾ (i++)

① count = count + j = 2 + 2 = 4

21 > 2x7 (✓) (j++)

21 > 2x9 (✓) (j++)

21 > 2x10 (✓) (j++)

21 > 2x11 (X) ⁽²⁾ (i++)

① count = count + j = 4 + 5 = 9

int j=0, count=0;

for (int i=0; i < left.length; i++) {

while (j < right.length && left[i] > 2 * right[j]) {

j++;

count = count + j;

}

Now, the above question converted in terms of p, q, r like merge (during merge sort)

p				q
2	6	12	13	21

q+1					r
4	5	7	9	10	11
	6	7	8	9	10

index

i = p (start)

j = q+1 (start)

```

int j = q + 1, count = 0
for(int i = p; i <= q; i++) {
    while(j <= r && right left[i] > 2 * right[j]) {
        j++;
    }
    count = count + (j - (q + 1));
}

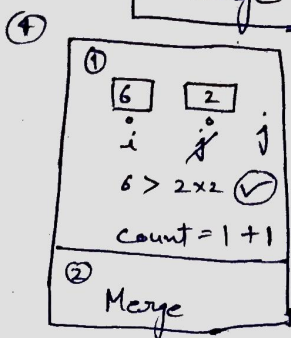

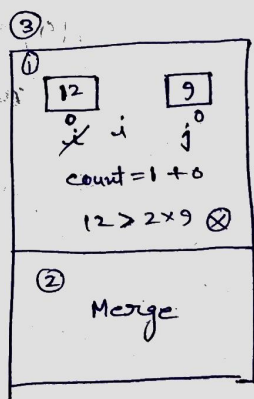

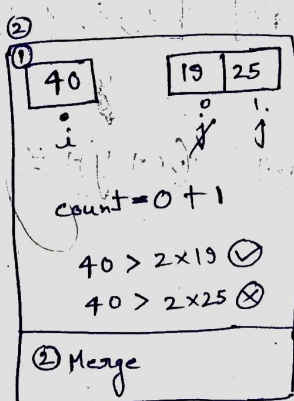

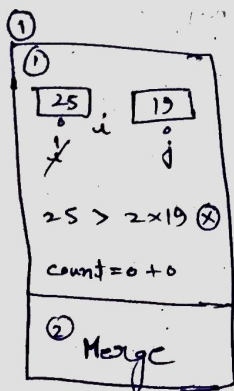

```

Now, we have an array:

40	25	19	12	9	6	2
----	----	----	----	---	---	---

Merge Sort

[40, 25, 19, 12, 9, 6, 2]

19	25	40
----	----	----

$\begin{matrix} 0 & 1 & 2 \\ \cancel{j} & \cancel{j} & \cancel{j} \end{matrix}$

2	6	9	12
---	---	---	----

$\begin{matrix} 0 & 1 & 2 & 3 \\ \cancel{j} & \cancel{j} & \cancel{j} & \cancel{j} \end{matrix}$

$$\text{count} = 4 + 3 + 4 + 4 = 15$$

$$19 > 2 \times 2 \quad (\checkmark)$$

$$19 > 2 \times 6 \quad (\checkmark)$$

$$19 > 2 \times 9 \quad (\checkmark)$$

$$19 > 2 \times 12 \quad (\times)$$

$$25 > 2 \times 12 \quad (\checkmark)$$

Merge Sort works here because we already know no. of pairs possible ~~in 19~~ with

$[19, 25, 40]$ say x . And we also know no. of pairs with $[2, 6, 9, 12]$ say y .

Now, we want no. of ~~pair~~ pairs with

$[19, 25, 40]$ $[2, 6, 9, 12]$ say z

$$\text{So, count} = (x + y) + z$$
